DNA Res. 9:180-197(2002).
-!- CATALYTIC ACTIVITY: Geranyl diphosphate + isopentenyl diphosphate
= diphosphate + trans, trans-farnesyl diphosphate.
-!- SUBCELULAR LOCATION: Cycoplasmic (Potential).
-!- SIMILARITY: Belongs to the FPP/GGPP synthetase family.
sequencing of a cytochrome P450 gene cluster from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                40; Gaps

                                The sequence analysis of the photosynthesis region of Rhodobacter (Choudhary M., Kaplan S.;

"DNA sequence analysis of the photosynthesis region of Rhodobacter sphaeroides 2.4.1."

"Nucleic Acids Res. 28:862-867(2000).

-! - CATALYTIC ACTIVITY: Trans-trans-farnesyl diphosphate + isopentenyl diphosphate = diphosphate + geranyl diphosphate.

-! - PATHMAY: Carotenoid and chlorophyll biosynthesis.

-! - SIMILARITY: Belongs to the FPP/GGPP synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PIR; S49625; S49625.

Shimizu N., Koyama T., Ogura K.;
Publecular Clohing, expression, and characterization of the genes
encoding the two essential protein components of Micrococcus luteus
B-P 26 hexaprenyl diphosphate synthase.;
J. Bacteriol. 180:1578-1581(1998).
-!- CATALYTIC ACTIVITY: Geranyl diphosphate + isopentenyl diphosphate.
= diphosphate + trans.trans-farnesyl diphosphate.
-!- SUBCELLUIAR LOCATION: Cytoplasmic (Potential).
-!- SIMILARITY: Belongs to the FPP/GGPP synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           15-UUL-1999 (Rel. 38, Created)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

by in Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon substrates.

Claim 15; Page 134-135; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopertenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a acrotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in

ô
the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of teroids flavours and tragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii geranylgeranyl pyrophosphate synthase (CTLE) enzyme
                                                                                                                                                                                                                                                                   180

prophosphate synthase (crtB), zeaxanthin glucosyl transferase (crtX), phytopen desaturase (crtI), phytoene synthase (crtB), zeaxanthin glucosyl transferase (crtX), (crtB) and beta-carotene hydroxylase (crtZ) enzymes (see ABP96685 to ABP96690) encoded by ACC44759 to ACC44764. (I) can be used for regulating carotenoid biosynthesis in an organism, by over-expressing (!) in an organism. (I) and the genes encoding (I) are useful for converting phytoene to the carotenoids, for creating recombinant organism; that has a phytoene various carotenoid compounds, and also for enhancing or manipulating carotenoid compounds. (I) can also be used for producing gene products having enhanced or altered activity
                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                    120

                                                                                                     This invention describes a novel method for the preparation of carotenoids using genes and proteins isolated from Candida utilis. The invention specifically describes the isolation of a 3-hydroxy-3-methylglutaryl coenzyme A (HWG-COA) reductase protein. This sequence represents the Candida utilis crtE protein which is used in the method of the invention. (Updated on 17-OCT-2003 to standardise OS field)

The present sequence represents a protein involved in carotenoid biosynthesis. The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtE, crtB, crtI, crtY, crtZ, crtX or crtW are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucoside are collected. The carotenoid glucosides are used as food additives. (Updated on 17-OCT-2003 to standardise OS field)

The present sequence is that of a recombinant Erwinia herbicola geranyl-

Geranyl pyrophosphate (GGPP) synthase. The N-terminal 13 residues of the
Cantive GGPP synthase (AAMOII19) are deleted and replaced by 4 extraneous
amino acids from pARC306, providing a more active enyzme. The most active
Co indicated in AAT40790. GGPP is a 20-carbon atom precursor of phytoene,
the first carotemoid in the carotemoid biosynthesis pathway. The phytoene
CC synthase (AAMOII21) participates in the pathway by providing phytoene
CF from GGPP. Production of total carotemoids in a plant can be increased by
CF transforming the plant with DNA encoding enzymes involved in the
CF biosynthesis pathway, in particular the lycopene cyclase gene (AAT40795).
CF biosynthesis prepared biosynthetically from phytoene through four
CF dehydrogenase (AAMOII23) in Erwinia sp. Beta- carotene is produced by

                                                                                                                                                                                                                                              The present invention describes beta-carotin hydroxylase. Beta-carotene can be used in the preparation of xanthophylls and their metabolites. The present sequence represents an Brwinia uredovora crtE protein sequence from the present invention. This sequence represents Erwinia herbicola geranylgeranyl pyrophosphate (GGPP) synthase encoded by DNA derived from the plasmid pARC489B. The enzyme encoded by this sequence differs from the wild type synthase in that 13 amino terminal trins are deleted and replaced by four extraneous amino acids. This causes the GGPP synthase to be more active. Certaninal truncation of the enzyme was found to further improve the citivity. GGPP synthase is an enzyme which is involved in the biosynthesis of carotenoids, esp. lycopene, from the ubiquitous precursor, farnesyl pyrophosphate. In E. herbicola, pytroene has been tound to be formed biosynthetically in a two-step process. The initial step is the condensation of farnesyl pyrophosphate (FPP) and isopentyl synthase. In this reaction is catalysed by GSPP pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopente (FPP) and isopentyl pyrophosphate which is used as a food colourant.

Commercial production of lycopene which is used as a food colourant by protected from the herbiciale norflurazon. (Updated on 25-MRA-2003 to correct PF field.) (Updated on 16-OCT-2003 to standardise OS field) Example 1; Fig 3; 87pp; English.

```
synthase. GGPP synthase is a enzyme which, along with phytoene synthase (see also AMW00343), catalyse the formation of carotenoids, particularly phytoene. The N-terminally truncated form of GGPP synthase has the first thirteen amino acids replaced by four heterologous amino acids derived from the plasmid pARC306A. This enzyme is about twice as active as the wild type enzyme. A C-terminal truncated protein was found to have even higher activity and was cloned into plasmid pARC489D. The GGPP synthase coding sequences may be attached to the transit peptide sequence given in AAW00344, for transport into tobacco chloroplasts. This allows the tobacco plants to produce high levels of phytoene for use in the treatment of skin disorders. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 16-OCT-2003 to standardise OS field)

```
Inverse true marketime mass been accorded mixing encourses and anywhintal metricolar molecule comprises at least 1125 bp and is present in the plasmids molecule comprises at least 1125 bp and is present in the plasmids parciaty, parcisty, parcisty and parciator. The present sequence represents the amino acid sequence corresponding to the preferred heterologous structural gene of Erwinia herbicola geranylgeranyl pyrophosphate (GGPP) synthase. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yeasts or plants, with increased beta-carotene levels. Beta-carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                      DNA encoding Erwinia herbicola lycopene cyclase - for producing recombinant enzyme, and transgenic organisms with increased beta-carotene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of the Erwinia herbicola geranylgeranyl. pyrophosphate (GGPP) synthase. GGPP is a 20-carbon atom precursor of phytoches, the first carctenoid in the carctenoid biosynthesis pathway. The phytoche synthase (AAW01121) participates in the pathway by providing phytoche from GGPP. Production of total carotenoids in a plant can be increased by transforming the plant with DNA encoding enzymes involved in the biosynthesis pathway, in particular the lycopene cyclase gene (AAT40795). Lycopene is prepared biosynthetically from phytoene through four sequential dehydrogenation reactions which can be carried out by a single dehydrogenase (AAW01123) in Erwinia sp.. Beta-carotene is produced by the action of lycopene cyclase on lycopene. A chloroplast transit peptide of the tobacco ribulose bis-phosphate carboxylase- oxygenase gene (see ANT40794) is operatively linked in frame to the 5' end of the total caroteural gene. This leads to increased production of total carotenoids in the chloroplast of transformed plants as compared to total carotenoids in the chloroplast of transformed plants as compared to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 native, non-transformed plants of the same type. Beta- carotene is an effective and apparently harmless food colourant and is also in the pathway for blological synthesis of further C40 carotenoids such as zeazanthin and zeazanthin dilucoside. (Updated on 25-MAR-2003 to correct pf field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  76 LDLACAVELTHTASLALDDMPCMDNAELRRGQPTTHKKFGSSVALLASVGLLSKAFGLIA 135

This sequence represents Erwinia herbicola geranylgeranyl pyrophosphate (GGPP) synthase encoded by DNA derived from the plasmid pARC376. GGPP synthase is an enzyme which is involved in the biosynthesis of carotenoids, esp. lycopene, from the ubiquitous precursor, farnesyl pyrophosphate. In B. herbicola, phytoene has been found to be formed biosynthetically in a two-step process. The initial step is the condensation of farnesyl pyrophosphate (FPP) and isopentyl pyrophosphate (IPP) to form GGPP, This reaction is catalysed by GGPP synthase. This first step is immediately followed by a tail to tail dimerisation of GGPP, catalysed by the enzyme phytoene synthase, to form phytoene by the catalytic action of phytoene dehydrogenase-4H. The genes encoding components of the lycopene commercial production of lycopene which is used as a food colourant. Plants transformed with the phytoene dehydrogenase-4H coding sequence are protected from the herbicide norflurazon. (Updated on 25-MAR-2003) to protected from the herbicide norflurazon. (Updated on 25-MAR-2003)
                                                                                                                                                                                                                                                                                                                                                                    E. herbicola; geranyigeranyl pyrophosphate synthase; pARC376; GGPP synthase; biosynthesis; carotemoid; lycopene; farnesyl pyrophosphate; phytoene; FPP; isopentyl pyrophosphate; IPP; tail to tail dimerisation; phytoene synthase; phytoene dehydrogenase-4H; food colourant; herbicide; norflurazon.

GGPB synthase is a enzyme which, along with phytoene synthase (see also AAW00343), caralyse the formation of carotemoids, particularly phytoene. The N-terminally truncated form of GGPP synthase has the first thirteen amino acids replaced by four heterologous amino acids derived from the plasmid pARC306A. This enzyme is about twice as active as the wild type enzyme. A C-terminal truncated protein was found to have even higher activity and was cloned into plasmid pARC489D. The GGPP synthase

coding sequences may be attached to the transit peptide sequence given AAM00344, for transport into tobacco chloroplasts. This allows the tobacco plants to produce high levels of phytoene for use in the treatment of skin disorders. (Updated on 25-MAR-2003 to correct PF field.) Example 2; Fig 2; 102pp; English

A novel DNA molecule has been isolated which encodes an Brwinia herbicola lycopene cyclase enzyme that converts lycopene to beta-carotene. The DNA molecule comprises at 1825 bp and is present in the plasmids pARC1510, pARC1510. The present in the plasmids amino acid sequence corresponding to the nucleotide base sequences of certain preferred DNA segments of the structural gene for geranyigeranyl pyrophosphate (GGPP) synthase. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yeasts or plants, with increased beta-carotene levels. Here carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 25-MAR-2003 to correct PF field.) **8888888888888888**
